

```
#include <stdlib.h>
#include <string.h>
#include <ctype.h>

#define MAXPAROLA 30
#define MAXRIGA 80

int main(int argc, char *argv[])
{
    int freq[MAXPAROLA]; /* vettore di contatori
delle frequenze delle lunghezze delle parole */
    char riga[MAXRIGA];
    int i, inizio, lunghezza;
    FILE *f;

    for(i=0; i<MAXPAROLA; i++)
        freq[i]=0;

    if(argc != 2)
    {
        fprintf(stderr, "ERRORE: serve un parametro con il nome del file\n");
        exit(1);
    }
    f = fopen(argv[1], "r");
    if(f==NULL)
    {
        fprintf(stderr, "ERRORE: impossibile aprire il file %s\n", argv[1]);
        exit(1);
    }

    while( fgets( riga, MAXRIGA, f ) != NULL )
```

Trees and BSTs

Interval BSTs

Paolo Camurati and Stefano Quer

Politecnico di Torino

Interval BSTs

- ❖ Interval BSTs are BSTs used to store close intervals
- ❖ A close interval is
 - An ordered real couple $[t_1, t_2]$, where
 - $t_1 \leq t_2$ and
 - $[t_1, t_2] = \{t \in \mathcal{R} : t_1 \leq t \leq t_2\}$
 - Open and half-open intervals omit both or one of the endpoints from the set
 - Extending our result to those intervals would be straightforward

Interval BSTs

❖ The interval item $[t_1, t_2]$ can be realized with a **struct** with fields

➤ $low = t_1, high = t_2,$ and max

The maximum **high** value in the tree rooted at that node

```
typedef struct node *link;
struct node {
    float low, high, max;
    link l;
    link r;
};
```

ADT

Interval BSTs

- ❖ Intervals i and i' have intersection iff
 - $low[i] \leq high[i']$ AND $low[i'] \leq high[i]$
- ❖ $\forall i, i'$ the following conditions stand
 - i and i' have an intersection

- $low[i] \leq high[i']$ AND $low[i'] > high[i]$

- $low[i'] \leq high[i]$ AND $low[i] > high[i']$

Interval
tricotomy

Example

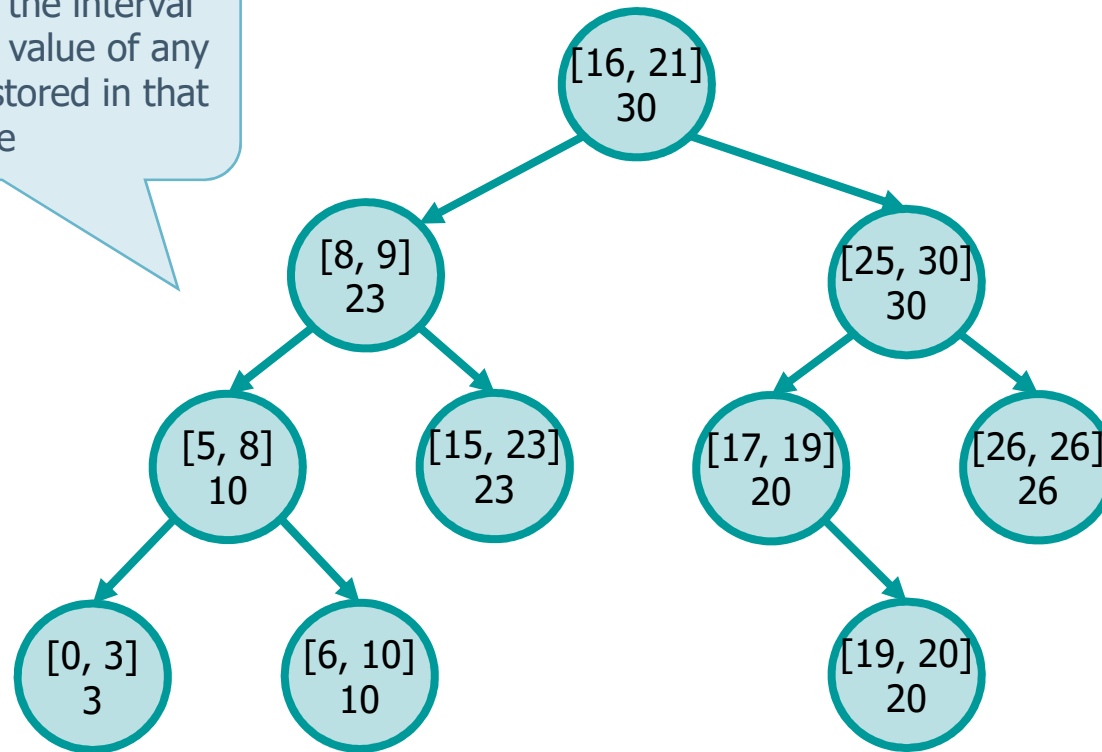

- ❖ A set of interval sorted by left endpoint

Example

❖ The same set of intervals into an Interval-BST

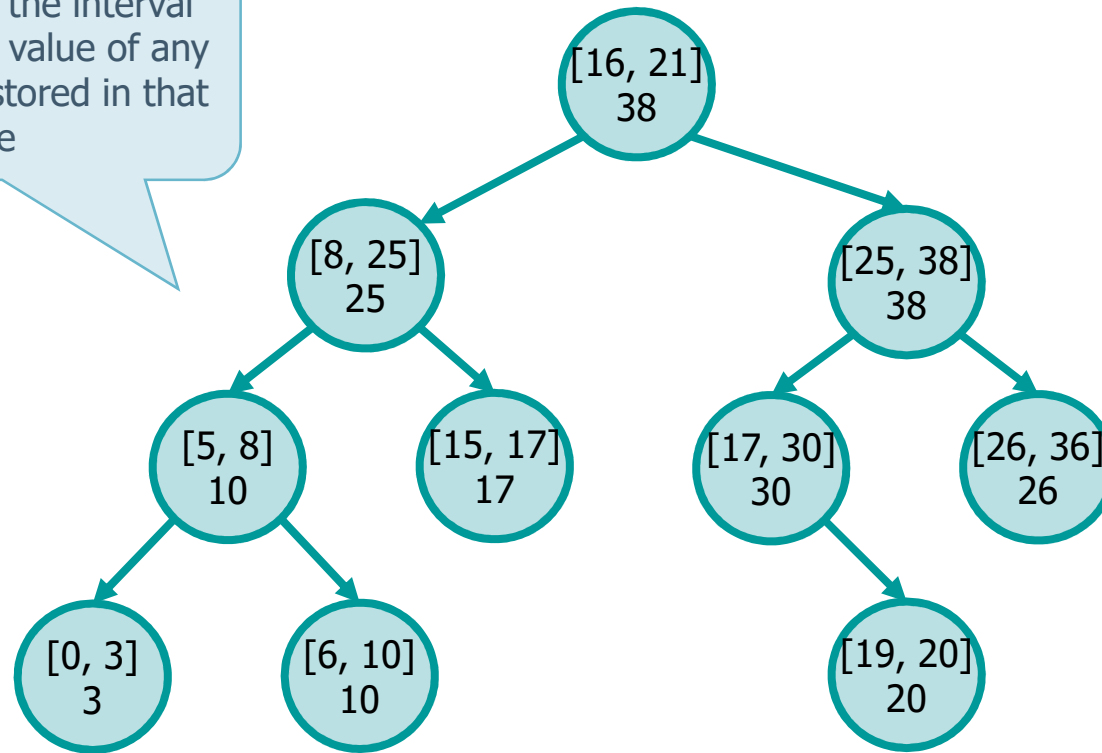

Each node stores the interval and the maximum value of any interval endpoint stored in that subtree

Example

❖ Another Interval-BST

Each node stores the interval and the maximum value of any interval endpoint stored in that subtree

Operations

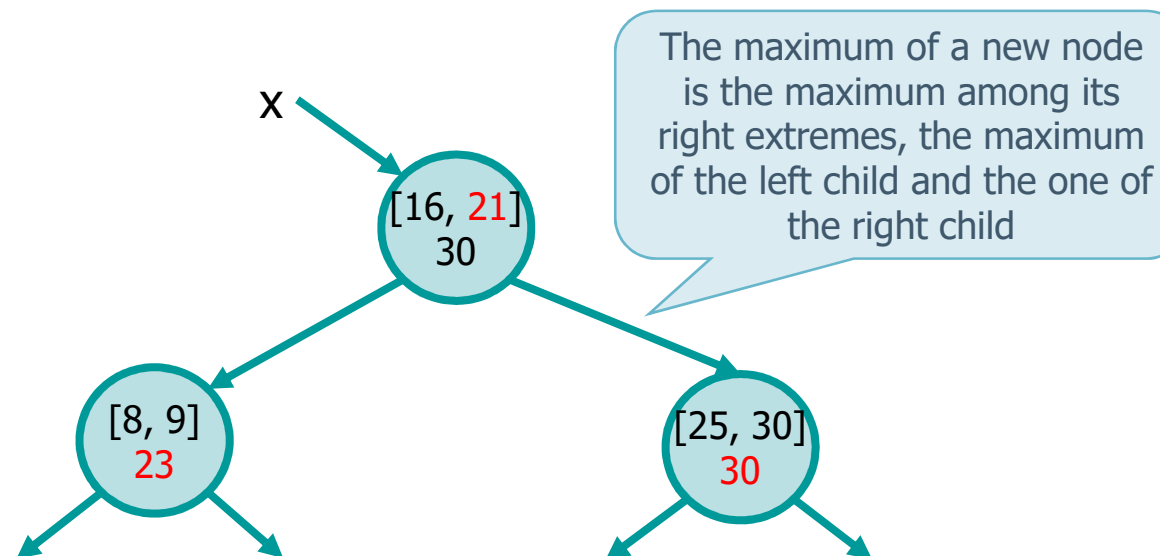

- ❖ As with BSTs with Interval-BSTs the following operations are possible
 - Insert an item (interval) into the Interval BST
 - `void IBST_insert (IBST, Item) ;`
 - Delete an item (interval) from the Interval BST
 - `void IBST_delete (IBST, Item) ;`
 - Search an item (interval) into the Interval BST and return the **first** interval with an intersection
 - `Item IBST_search (IBST, Item) ;`

Insert

- ❖ To insert a new node into an I-BST
 - It is sufficient to use a "standard" BST insertion procedure "working" on the **left endpoint**
 - It is necessary to determine the **maximum value** for each new node
- ❖ An inorder tree walk of the tree lists the nodes in sorted order by left endpoint

Insert: Evaluation of the maximum

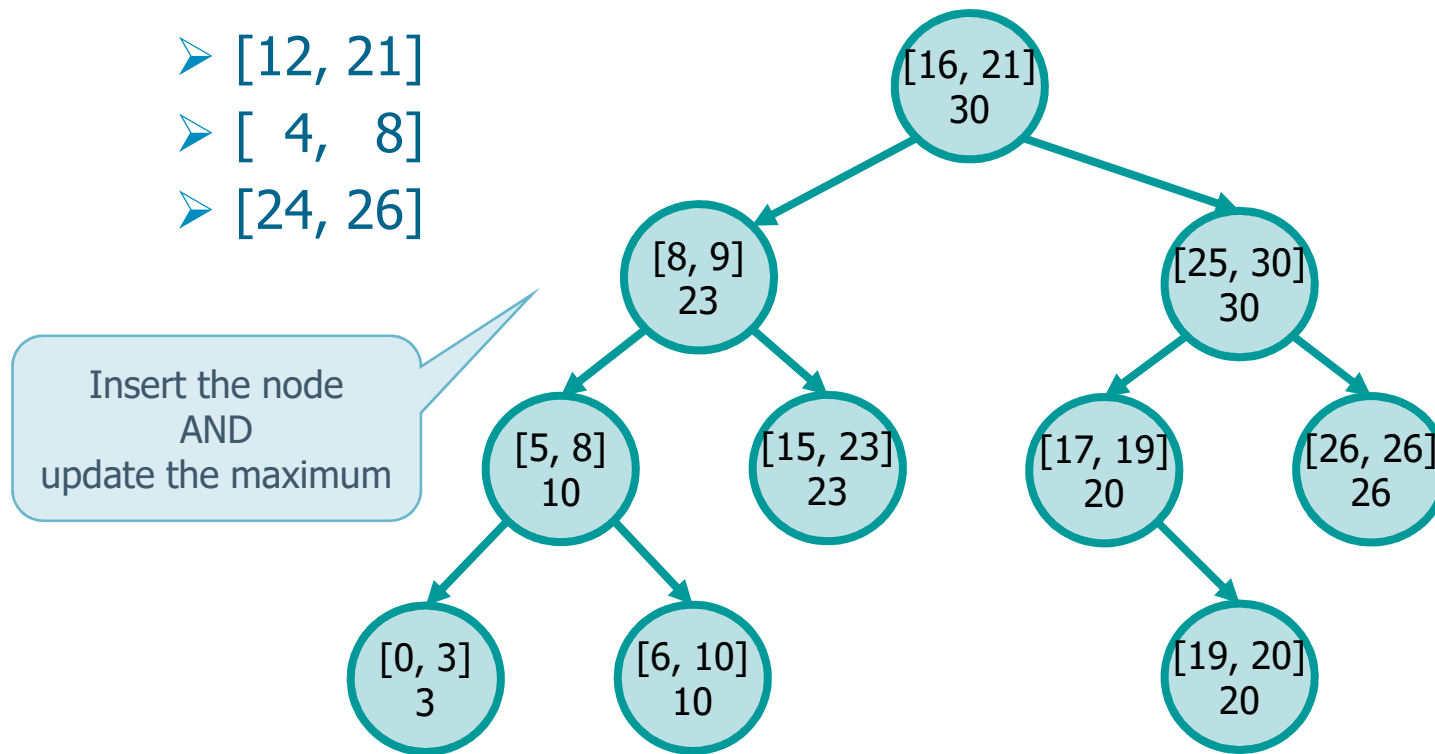

- ❖ The evaluation of the maximum has complexity $\Theta(1)$ for each new node inserted
 - $x \rightarrow \text{max} = \max(\text{high}(x), x \rightarrow \text{left} \rightarrow \text{max}, x \rightarrow \text{right} \rightarrow \text{max})$

Examples

❖ Given the following Interval-BST insert nodes with intervals

- [12, 21]
- [4, 8]
- [24, 26]

Delete

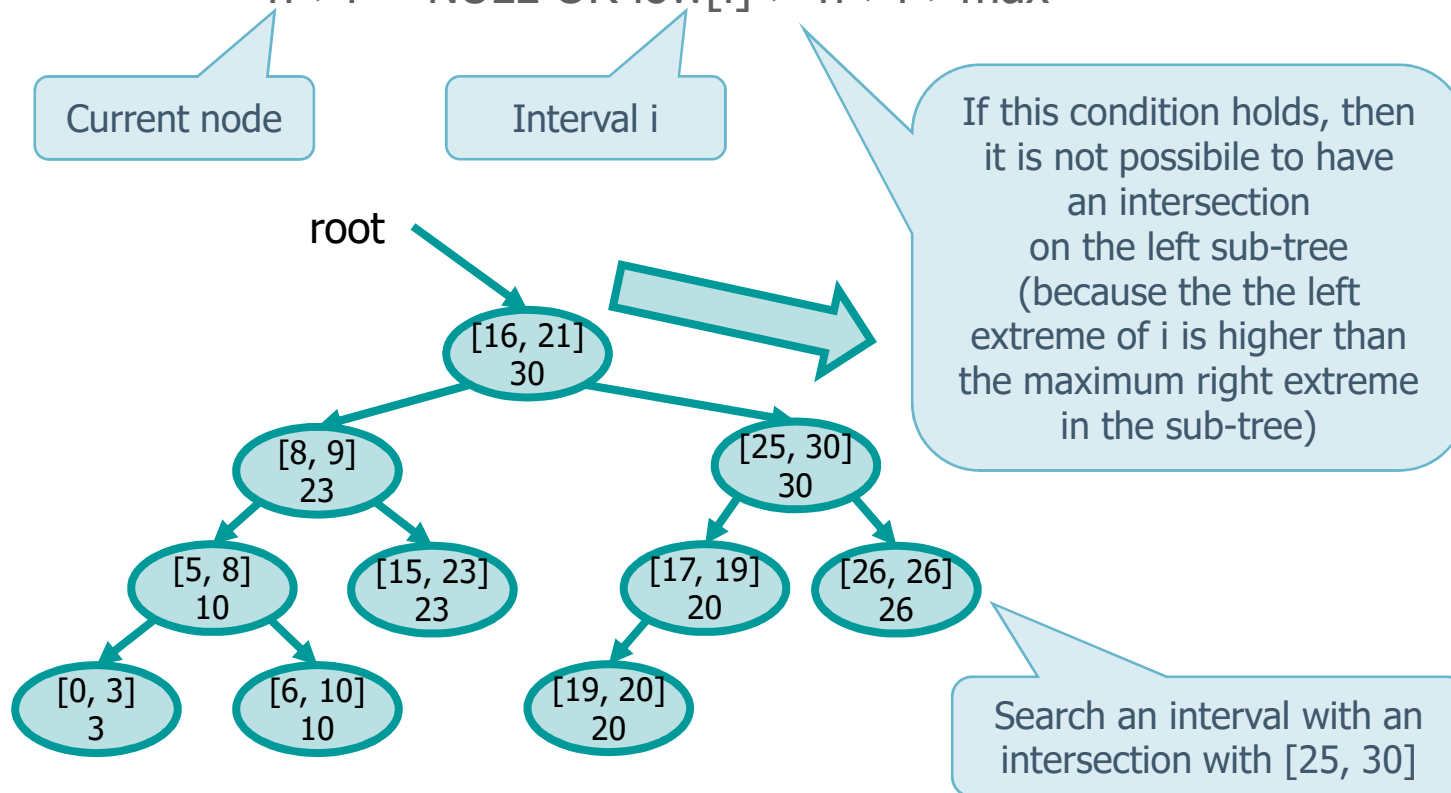

- ❖ To delete a node within an Interval-BST it is necessary to do two steps
 - Search the element to delete and
 - Delete it
- ❖ Search is the only new operation we have to develop
- ❖ Delete, once the element has been found, can be performed using the "standard" approach presented with BSTs

Search

- ❖ On an Interval-BST, when we search for an interval i usually we look-for a node n with an interval having an intersection with interval i
- ❖ The algorithm works as follow
 - Visit the tree from root
 - Termination
 - Find an interval with an intersection with i or
 - An empty tree has been reached
 - Recursion from node n
 - On the right sub-tree
 - On the left sub-tree

Search

- We recur on the right sub-tree if
 - $n \rightarrow l == \text{NULL}$ OR $\text{low}[i] > n \rightarrow l \rightarrow \text{max}$

Search

- We recur on the left sub-tree if
 - $n \rightarrow l \neq \text{NULL} \text{ AND } \text{low}[i] \leq n \rightarrow l \rightarrow \text{max}$

Interval i

Current node

If this condition holds, then if there is no intersection on the left sub-tree then there is no intersection on the right sub-tree as well. Why is that?

Search an interval with an intersection with [21, 27]

Search

➤ We recur on the left sub-tree if

- $low[i] \leq n \rightarrow l \rightarrow max$

Interval i

Current node

There is no intersection on the left when

Then, on the right low endpoints are even higher

Search an interval with an intersection with [21, 27]

Examples

❖ Given the following Interval-BST search intervals

- [22, 25]
- [24, 27]
- [4, 5]

Application

- ❖ Given N rectangles placed with sides parallel to the Cartesian axis
 - Check whether a new rectangle has an intersection with another rectangle

Application

- ❖ **Electronic CAD Application**
 - Verify if there are connections with an intersection on an electronic circuit
- ❖ **Basic Algorithm**
 - Check the intersection among all rectangle couples
 - Complexity $O(N^2)$

Application

❖ Algorithms using IBST

- Order rectangles based on ascending left extreme x-values
- Iterate on rectangles for ascending x-values
 - When a left extreme is encountered, **insert** the y-value range into an I-BST and check for intersections
 - When a right extreme is found, **remove** the interval from the I-BST y-values
- Efficient algorithm
 - Complexity $O(N \cdot \log N)$
 - Applicability to VLSI and beyond

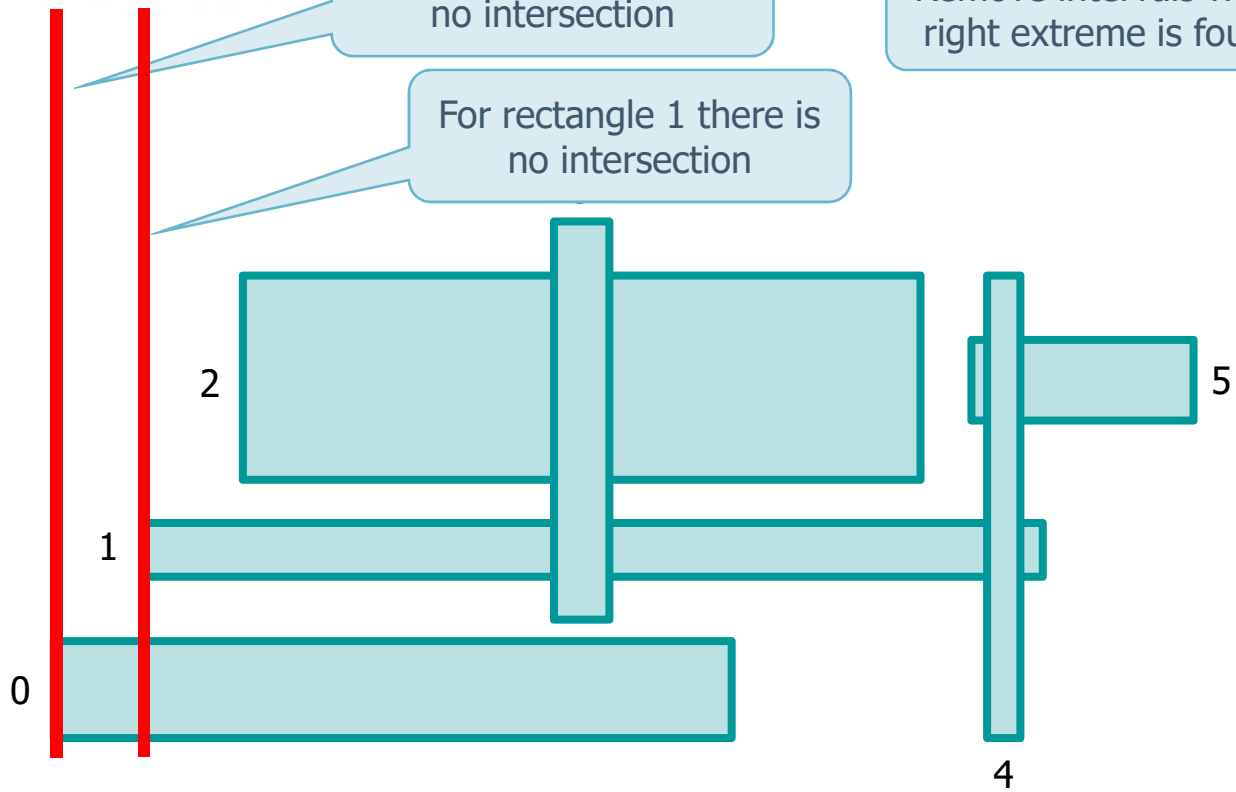

Application

Insert interval on y-values
Start from rectangle 0 on

For rectangle 0 there is
no intersection

For rectangle 1 there is
no intersection

Remove intervals when
right extreme is found

Complexity Analysis

- ❖ **Sorting**
 - $O(N \cdot \log N)$
- ❖ **If the IBST is balanced**
 - Each insertion/deletion of an interval or search of the first interval that intersects a given one has cost $O(\log N)$
 - Searching for all intervals that intersect a given one has cost $O(R \log N)$, where R is the number of intersections

Exercise

- ❖ Given an initially empty Interval-BST, perform the following insertions
 - [3,10] [4,6] [1,3] [16,21] [7,11]
 - [2,8] [12,19] [5,15] [9,10]
- ❖ Then, search intervals
 - [11,13]
 - [23,25]
 - [18,21]

Exercise

- ❖ Given an initially empty Interval-BST, perform the following insertions
 - [3,5] [7,9] [1,2] [2,4] [8,12]
 - [13,21] [14,17] [11,15] [0,1]
- ❖ Then, search intervals
 - [20,25]
 - [16,19]
